

Article DB Schema

For article table, choosing title as PK seems appropriate as it'll be unique across the database and allows user to directly access article details on its basis (i.e not going through an integer PK)

Setting Integer PK for Category is better as we are referencing (FK) it in article table (as integer keys increase performance) and reduces redundancy. Here, the category name will be unique so a UNIQUE constraint/index is added as well on name field

Finally, we separate article references into a links table, pointing to original article and its linked article in a single row. Both fields are FK's. Thus, appears as a good fit for composite PK
